

## *VScom Serial Device Servers: Windows Driver for the Phased out NetCom Lite and PRO Devices*

Both device types won't be manufactured and sold for many years now. Hence the software support has stopped and the new driver supports NetCom Plus devices only.

You can try to use the old signed [driver](#) or this [one](#) . If it doesn't work with the newer Windows versions, we cannot help you further.

The best way to install the old drivers on Windows 10 is to install Windows 7 and the old signed driver and then to upgrade to Windows 10.

Another workaround would be to use TCP or UDP modes directly. This will make your application operating system independent as you don't have to install the NetCom driver.
